RESEARCH INTERESTS

I work on computer vision, machine learning, and natural language processing – very often at their wonderful intersection. My focus is *"semantic vision"*, i.e. building systems that assign meaning to scenes captured by cameras. My domain expertise lies in devising adversarial machine learning algorithms to improve the robustness of semantic vision systems, under situations such as domain shift, semantic shift, signal corruptions, etc. as well as learning to discover useful data transformations that can improve the diversity of training data. I am also interested in developing frameworks and benchmarks for analyzing and evaluating the robustness, reliability, and generalizability of semantic vision systems.
